📌 **Milestone 1: Problem Identification & Requirement Analysis (30/01/2026)**
Objective: Clearly understand *what problem* the software will solve.
Deliverables:

- Problem statement
- Project objectives
- Functional requirements
- Non-functional requirements
- Feasibility study (technical, economic, operational)

Outcome:
A well-defined project scope and clear understanding of user needs.

📌 **Milestone 2: System Design & Planning (13/02/2026)**
Objective: Design *how* the software will work.
Deliverables:

- System architecture diagram
- UML diagrams (Use Case, Class, Sequence, etc.)
- Database design (ER diagram / schema)
- Technology stack selection
- Project plan and timeline

Outcome:
A complete blueprint of the system before coding starts.

📌 **Milestone 3: Implementation / Development (16/03/2026)**
Objective: Convert design into a working software system.
Deliverables:

- Source code (module-wise)
- Front-end and back-end integration
- Database implementation
- Version control repository (e.g., Git)

Outcome:
A functional software system with core features implemented.

📌 **Milestone 4: Testing & Validation (02/04/2026)**
Objective: Ensure the software works correctly and reliably.
Deliverables:

- Test cases (unit, integration, system testing)
- Bug reports and fixes
- Performance and security testing (if applicable)
- Validation against requirements

Outcome:
A stable and error-free software application.

📌 **Milestone 5: Documentation, Deployment & Final Presentation (16/04/2026)**
Objective: Finalize the project for submission and demonstration.
Deliverables:

- Project report (SRS, design, implementation, testing)
- User manual
- Deployment setup (local/cloud)
- Final project presentation and demo

Outcome:
A complete, documented, and deployable software project ready for evaluation.
